### Attestations

Esophageal Manometry - Drugs such as nitrates, calcium channel blockers, theophylline, metoclopramide (Reglan) or diazepam (Valium) may affect esophageal motor activity. It is preferable to stop these drugs 24 hours prior to the test, if it is safe for your patient to do so.

24 Hour pH Impedence - In order to perform 24-Hour pH monitoring, esophageal manometry must first be done to locate the lower esophageal sphincter. Drugs such as proton pump inhibitors (Aciphex, Dexilant, Nexium, Prevacid, Prilosec, Protonix) or H2 blockers (Zantac, Pepcid, Axid, Tagamet, Zegerid) affect test results. It is preferable that these drugs be withheld 7 days prior to the test. If you want to see results while on medical therapy, you may continue the medications.

48 Hour Bravo - In order to perform 48 Hour Bravo pH monitoring, location of the Z line must be known or esophageal manometry must first be done to locate the lower esophageal sphincter. Drugs such as proton pump inhibitors (Aciphex, Dexilant, Nexium, Prevacid, Prilosec, Protonix) or H2 blockers (Zantac, Pepcid, Axid, Tagamet) affect test results. It is preferable that these drugs be withheld 7 days prior to the test. If you want to see results while on medical therapy, you may continue the medications.

Anorectal Manometry with EMG - Performing anorectal manometry requires an alert and conscious patient. Local application of nitrates may affect pressure results.
