Solarity Fax and Scanning Completes Successful Launches

The Solarity automated faxing and scanning system has successfully launched at HMH, HMB, HMCL and SPG/PCG, in compliance with HIMSS Stage 7 requirements. This new system brings improved patient safety by making incoming patient information available in Epic sooner and improving indexing accuracy.

Until now, patient medical records were faxed here, with staff scanning the faxes into our database and then filing the faxes. Solarity has replaced this labor-intensive process with automation that expedites medical record availability in Epic, especially considering that staff manually handled nearly 13 million pieces of paper each year. Solarity also makes it easier to find documents in Epic by applying standard classifications across all areas.
